

# ESS Sedum

Sedum is an extremely adaptable plant. Its special properties include:

**Low Maintenance** – once established sedum forms a tightly knit sedum carpet, which allows little room for the development of weeds and can be left largely unattended.

**Low Growing** – sedum is a low growing plant, which generally reaches a height of 2cm to 5cm (up to 10cm when in flower). It does not become overgrown and does not require regular cutting or pruning.

**Colourful Hues** - There is a wide variety of sedum species available and every one offers a different colourful hue from a diverse range of greens through to vibrant reds, oranges and purples and more autumnal browns. As well as offering a huge variety of colour, the different plants offer many different leaf types and flowers, resulting in a blend of beautiful textures when planted together, which creates sedum turf with richly diverse colour, texture and flowers. This provides a naturally beautiful turf, which blends easily into natural landscapes or presents an oasis of colour in more urban surroundings.

These properties mean sedum is particularly useful for use in out of the way and difficult to reach environments as once laid it will not require regular attention. It is therefore regularly used on green roofs, roundabouts, road verges, central reservations and embankments.
